Abstract

Electron scattering by nucleons plus six-quark contributions can explain $F_{ch}({}^3\text{He})$ for $q \leq 1$ GeV/c. At higher momentum transfer, $q \leq 1.5$ GeV/c, nine-quark processes dominate, possibly taking one to the region where perturbative QCD can be tested at $q \geq 2$ GeV/c.

There are no figures or tables for this document.
